#### IMMUNOASSAY

| Test Name                                         | Result       | Unit | Biological Ref. Interval |
|---------------------------------------------------|--------------|------|--------------------------|
| <b>Tridot Panel</b>                               |              |      |                          |
| <b>HIV I&amp;II Antibody Screen (Qualitative)</b> | Non reactive |      | Non reactive             |
| <i>Serum</i>                                      |              |      |                          |
| Rapid Card Method                                 |              |      |                          |

#### Comment:

- \* It is a rapid screening procedure which cannot be used as a sole criteria for diagnosis of HIV infection.
- \* A non reactive result implies that no anti HIV I or anti HIV II antibodies have been detected in sample by this method. This means that either the patient has not been exposed to HIV-1 or HIV-2 infection or the sample has been tested during WINDOW PHASE (before the development of detectable level of antibodies).
- \* A reactive result suggests the possibility of HIV I-II. All positive cases are advised a repeat tests using another methodology. Confirmation by Western Blot / molecular technique (RT-PCR) is mandatory before pronouncing the patient positive for HIV I / II.
- \* Rarely false negativity or positivity may occur.
- \* All results to be read in conjunction with clinical findings and all positive patients should be counselled.

The Test is performed at Oncquest Laboratories Ltd.

HBsAg Screen (Qualitative)

*Serum*

Non Reactive

Non Reactive

Rapid Card Method

**Comment:**

Test done by immunochromatographic method.

In case of positive result, confirmation by Quantitative assessment is advised.

Further Investigations like-- HBV DNA Quantitative / Viral Load Assay ( Real Time PCR) and various hepatitis B markers are advised in all Hepatitis B (HBsAg) positive cases.

Co-infection: About 10% of patients with chronic hepatitis B also are co-infected chronically with hepatitis C virus (HCV).

The two viruses interfere with each other and one usually predominates. Patients infected with both viruses are at higher risk for complications of liver disease. If the patient is positive for Hepatitis B then screening for Hepatitis C virus is strongly recommended.

सेवा में

श्री मान् अधीक्षक

रिजिफ इण्डिया दरद

D - 22 लेक 22 - 3

नौरडा (उ० प्र०)

विषय :- मेरी बेटी के इलाज के लिए आर्थिक  
सहायता हेतु प्रार्थना पत्र ।

श्री मान्,

सविनय निवेदन यह है कि मेरा नाम  
विशाल रस्तोगी है और मेरी बेटी का  
नाम नन्दनी रस्तोगी है । जिसका उम्र १५ साल  
है । मेरी बेटी का इलाज दिल्ली के  
रामस हॉस्पिटल में चल रहा है । जिसका  
कुल खर्च दो लाख रु० बताया गया  
है । मेरी बेटी को ब्लाड कैंसर की शिकायत  
है । मेरी बेटी के इलाज के लिए पैसा  
का इंतजाम नहीं हो पा रहा है ।

आपसे निवेदन है कि मुझे इलाज  
के लिए आर्थिक सहायता प्रदान करें ।  
आपकी सहायता मेरी बेटी को नया जीवन  
दे सकती है । धन्यवाद

श्री  
विशाल रस्तोगी

Anti HCV (Qualitative)

Non Reactive

Non Reactive

Serum

Rapid Card Method

**Comment:**

- \* Hepatitis C is an infection of the liver caused by the hepatitis C virus (HCV).
- \* The presence of anti-HCV indicates that an individual may have been infected with HCV, and/or may be capable of transmitting HCV infection.
- \* Although majority of infected individuals may be asymptomatic, HCV infection may develop into chronic hepatitis, cirrhosis with increased risk of hepatocellular carcinoma.
- \* If the test for HCV antibody is positive, additional testing is recommended to confirm the diagnosis with other confirmatory test.
- \* Recombinant immunoblot assay (RIBA) or molecular tests such as HCV RNA Quantitative/Viral Load Assay (Real Time RT PCR) are a few additional tests which are advised to confirm the diagnosis. Further, HCV genotyping identifies the specific genotype of HCV from 1-6 involved in infection.
