MRI

CEMRI BRAIN AND ORBITS

STUDY PROTOCOL:

FLAIR, SPIN-ECHO T1 W and FAST SPIN-ECHO T2 W axial images and T2W CORONAL IMAGES of brain were obtained on dedicated quadrature head coil. DW images were also obtained. Coronal T2W & STIR images of orbit were also obtained. POST CONTRAST T1W IMAGES WERE TAKEN IN ALL PLANE SEQUENCES.

FINDINGS:

Cerebral parenchyma appears normal with normal signal intensity on FLAIR, T2, T1 and images. No focal lesion is seen. Myelination pattern is normal.

Bilateral basal ganglia, thalami and internal capsules appear normal.

Brainstem and cerebellum reveal normal signal intensity.

No evidence of any restricted diffusion on DW images.

Sella and supra-sellar regions are normal.

No evidence of abnormal post contrast leptomeningeal enhancement seen.

Ventricular system is normal with the septum in midline.

MRI

Major intra-cranial flow voids are preserved.

Both eyeballs are normal in position with normal size and outline. There is evidence of displacement of the lens of right eyeball posteriorly in the vitreous which shows altered signal intensity appearing bright on T2W images. Choroid scleral thickness is normal.

Areas of hyperintensity on T2W images and intermediate signal on T1W images are seen in subretinal areas on both sides in right eye with elevated retinal membrane suggestive of subretinal exudates with likely retinal detachment.

Similar signal intensity is seen in anterior chamber likely hyphema.

Heterogeneous soft tissue intensity area is seen obliterating the vitreous chamber showing intermediate signal on T1 & T2W images and showing mild heterogeneous post contrast enhancement. Few areas of GRE blooming also seen within the soft tissue [On CT correlation, an eccentric focus of calcification seen in the vitreous chamber].

Optic-nerve sheath complex in both sides are normal in course and thickness.

Retro-orbital fat and extra-ocular muscles are normal.

IMPRESSION : MRI ORBITS REVEALS SUBRETINAL EXUDATES WITH RETINAL DETACHMENT IN, RIGHT EYEBALL ALONGWITH HYPHEMA AND POSTERIOR DISPLACEMENT OF LENS OF RIGHT EYE. HETEROGENEOUSLY ENHANCING SOFT TISSUE INTENSITY AREAS IN THE VITREOUS CHAMBER OF RIGHT EYEBALL SHOWING AREAS OF BLOOMING WITH ECCENTRIC FOCUS OF CALCIFICATION [AS CORRELATED ON CT] ? RETINOBLASTOMA ?? POST TRAUMA CHANGES.

Received on : 29/9/2014

Hosp. Reg. No. : 28372

Date of Report : 8/10/2014

Ward IB

Bed No. : 157

Unit Incharge : Prof. P. Sharma

Nature of the Material Submitted : Enucleated eye

Report :

Right eye enucleated specimen.

- Poorly differentiated retinoblastoma with large areas of necrosis & haemorrhage.
- Massive choroidal invasion identified.
- Optic nerve head along with retrolaminar area is involved by tumor.
- Subarachnoid space is infiltrated by tumor cells.
- Sclera, iris ciliary body, anterior chamber are all involved by tumor along with extrascleral deposit seen.
- Pathologic classification is pT4bNoMo.

विषय → आरती के उलाह डेलु |

महोदय,

आपको भालूम है कि मेरा नाम सागर है और मैं औरवला दिल्ली का रहने वाला हूँ। मेरी बेटी आरती जो की मात्र 3 वर्ष की है उसे आरती में कैसा है मजा है। उसका उलाह दिल्ली के बाजार अस्पताल में चल रहा है। दायरे में बताया की इसके उलाह में 25,000 रु लगेंगी। महोदय, मैं एक मासुली दिल्ली मल्लु हूँ जो की मजद महीने का 4500/-रु कमाता हूँ और मैं इसका उलाह करने में इच्छम हूँ। कृपा करके मेरी बच्ची का उलाह करने में सहायता करे। अब मेरी बच्ची की डिग्री आपन ध्यान में है।

धन्यवाद

पिता
